

III. In the Claims.

1. Please amend claim 9 and add new claims 10-15.
-

1. [Original] A shaft comprising:

an outer member having an inner surface describing a bore;
an inertial member disposed within the bore and having an
outer surface; and

a resilient member compressed between the outer member
inner surface and the inertial member outer surface for damping
a shaft vibration.

2. [Original] The shaft as in claim 1 further comprising:

a relief in the inertial member outer surface for
mechanically engaging the resilient member.

3. [Original] The shaft as in claim 2, wherein the resilient
member is compressed in a range of 5% to 50% of an uncompressed
thickness between the inner surface and the outer surface.

4. [Original] The shaft as in claim 2, wherein the inertial
member damps a bending vibration.

5. [Original] The shaft as in claim 1, wherein the inertial
member further comprises a groove extending parallel to a shaft
centerline.

6. [Original] The shaft as in claim 1 further comprising:

a plurality of inertial members engaged with a plurality
of resilient members.

7. [Original] A shaft damper comprising:

an inertial member having an outer surface;

a resilient member engaged with the outer surface; and

the resilient member having a resilient member outer surface for engaging a shaft bore surface.

8. [Original] The shaft damper as in claim 7 further comprising:
a profile in the inertial member outer surface for mechanically engaging the resilient member.

9. [Amended] The shaft damper as in claim 7, wherein the inertial member outer surface [profile] further comprises a groove extending parallel to an inertial mass centerline.

10. [New] The shaft as in claim 2, wherein the relief comprises a groove.

11. [New] The shaft as in claim 2, wherein the relief comprises a geometric shape.

A,
(cont'd) 12. [New] The shaft as in claim 11, wherein the geometric shape comprises an arcuate shape..

13. [New] The shaft damper as in claim 8, wherein the profile comprises a groove.

14. [New] The shaft damper as in claim 8, wherein the profile comprises a geometric shape.

15. [New] The shaft damper as in claim 14, wherein the profile comprises an arcuate shape.
